

Malaria Prevention and Vector Control

WHO-based knowledge-base brief for SehatAI Pakistan

Purpose

WHO malaria guidance identifies vector control as a major component of malaria prevention and control.

Key themes

- Insecticide-treated nets and indoor residual spraying are important malaria vector-control interventions in appropriate settings.
- Additional vector-control measures may be used depending on the local epidemiological and operational context.
- Prevention strategies should be adapted to local malaria risk and public-health guidance.
- Suspected illness should be evaluated by qualified health professionals; the AI should not prescribe antimalarial medicines.

Use in SehatAI

Use this document for general malaria prevention and vector-control information, especially in disaster and displacement contexts.
