

Safe Water After Emergencies and Disasters

WHO-based knowledge-base brief for SehatAI Pakistan

Purpose

WHO guidance explains household water treatment and safe storage when emergencies disrupt access to safe drinking water.

Key themes

- After disasters, households may need to treat drinking water until the supply is tested and considered safe or local authorities provide other guidance.
- WHO describes approaches including appropriate boiling, filtration, solar treatment and chemical disinfection methods.
- Safe storage and hygienic handling are important because treated water can become contaminated again.
- When using a commercial treatment product, users should follow that product's instructions and local public-health advice.

Use in SehatAI

Use this document for safe-water and post-flood household guidance. Avoid inventing chemical doses or product-specific instructions unless they are explicitly supported by the retrieved source.
